Homework practice - String variables:

Most important - Feel free to be CREATIVE !
There are many ways to solve each step.

Task steps
1.Declare a string named "windows_serial_number"
and give it the value "abc-def-ghi-jkl"

2. Create new 4 variables. Each variable will contain 3 letters out of the above 'windows_serial_number' variable.
Use with a 'new' perfix in their name.
hint: Use 'index' range, to extract exactly what you need from the 'original' variable from step 1

3. Use 'replace' action, and **set** on each of the above new variables to be the following values : "aaa", "bbb", "ccc" , "ddd".
Meaning : new_partial_variable_a should have the value -> "aaa" , and so on..

4. Create a new variable called 'encoded_windows_serial_number', which should be built of the new four variables divided with '-'
hint : (encoded_windows_serial_number = "aaa-bbb-ccc-ddd")

5. Print the new serial number and mention with plain text that this is the encoded serial number, and add the new serial number to be printed
